

SAMUEL GRAYSON

Atlanta, GA | 678.294.8443 | samuel.c.grayson17@gmail.com

PROFESSIONAL SUMMARY

Highly motivated, technical engineering lead with 9 years of extensive experience delivering solutions for complex problems. Full-Stack development proficiency using Python, Javascript, and Java frameworks. Multiple experiences creating, implementing, and delivering robust architecture designs for Multi-Cloud solutions. Experience in many different industries including Automotive, Insurance, Financial, and Hospitality.

SKILLS

- | | | |
|----------------------------|----------------------|-----------------------------|
| → Team leading | → AWS API Gateway | → Agile Principles |
| → Mentoring | → AWS Console | → Github Actions |
| → Discovery and design | → AWS Cloudwatch | → Relational DB |
| → AWS Cloud Infrastructure | → AWS S3 | → Non-Relational DB |
| → AWS Lambda | → Python, FastAPI | → Datadog |
| → AWS DynamoDB | → Java, Spring Boot | → Docker |
| → AWS RDS | → React, Next, Remix | → Terraform |
| → AWS SNS | → TypeScript | → Microservice Architecture |
| → AWS Cloudformation | → Node, Express | → GIT |

CERTIFICATIONS

2021 (expired 2024)

AWS Certified Solutions Architect – Associate

AWS

WORK HISTORY

June 2022 - Current

Senior Software Architect | Slalom_Build | Atlanta, GA

Technical Lead - Internal commodity pricing application

- Coached agile practices and discovered early release candidates to get value out of the product ahead of client negotiations. (original first delivery slated for Fall 2024)
- Refactored cloudformation repository to leverage trunk based deployment to simplify process.
- Implemented refresh token, Okta OAuth 2 flow to improve user experience.
- Implemented e2e integration infrastructure to increase confidence in our CICD process.
 - Leveraged playwright, github actions, and zephyr reporting to automate the QE process.
- Technical design for ingestion pipeline of csv files into AWS and internal application
- Pushed for refactoring of the caching system from Spring Boot's default caching layer to a containerized redis service.
- Added datadog monitoring and alerting for the production system.
 - Alerts writing to slack for quick triage and review.
- *Technologies:* Cloudformation, Next.js, Relational Databases, Java Spring Boot, AWS Lambda, AWS EKS, Docker, Github Actions

Technical Lead - GenAI chatbot and medical assistant client POCs

- Worked with an internal team to build two GenAI client POCs.

- Leveraged Langchain and AWS bedrock large language models.
 - These POCs were presented to potential clients to explore the possibilities of GenAI in the medical field.
- One project consisted of a 3D avatar to answer questions about the company and opening support tickets to show the value of automating this flow.
 - API connection with third parties to create support tickets, notify the user, and track the progress.
- Another project consisted of a file upload process, an automated summary, and a question answering system to give insurance agents an overview of the patient's medical history.
 - Used in coordination with medical providers to confidently review a patient's profile to make decisions on approvals.
- *Technologies:* Terraform, Remix.js, Relational Databases, Langchain, AWS Lambda, AWS Bedrock LLM

Cloud Solution Architect - State government agency

- Lead discovery sessions with multiple internal teams to map out the current state of the technical infrastructure.
- Conducted interviews with technical and non-technical personnel on everyday use of the application to get a better understanding of MVP features.
- Created a future state vision for a data exchange platform for the state.
- Delivered future state vision and roadmap.
- Presented the future state vision and roadmap to state stakeholders to promote adaptation and build interest from policy makers.
- *Technologies:* Miro, AWS, Azure

Senior Team Lead - Back office restaurant application

- Managed two sub-pod workstreams for a recipe OCR system and external and internal inventory API
- Lead a team of a total of 8 engineers, 2 QEs, and 2 DEs.
 - Mentored engineers on software best practices.
 - Held regular 1-on-1s with the team to focus on career growth and well-being.
 - Analyzed Agile reporting to get the best outcomes from the team.
- Delivered a successful 1.0 release and maintained a very high average velocity.
- Co-lead discovery refinement for future epics and investigated internal systems for integration points and other requirements.
- Implemented reusable terraform templates for GCP based infrastructure.
- Implemented git actions to support continuous integration and automate complex deployments.
- Lead deep-dive sessions into future work to increase clarity and ease of development.
- Designed and implemented virus scanning integration for files during the OCR and Vendor catalog upload process.
- Designed and planned database refactor to support future epics due to tightly coupled data entities.
- Built strong relationships with internal client stakeholders and co-workers.
- *Technologies:* GCP, AWS, React, Relational Databases, AWS Lambda, Node.js

SE lead for internship program

- Interviewed potential candidates
- Worked with other program leads to rank and give feedback to candidates

Hackathon co-lead

- Implemented GenAI photo creation integration
- Worked with team to put together pitch deck
- Kept the team informed and on track to meet project requirements and deadlines.

Dev Coach & Mentor

- Met with co-worker regularly to discuss promotion plan and assess their progress.

- Sounding board for co-worker's internal project to increase exposure, build technical expertise, and provide feedback.

April 2021 - June 2022

Senior Software Engineer I | Groundspeed Analytics, Inc. | Ann Arbor, MI - Remote - Atlanta, GA
Integration Team

- Provided technical leadership for a small team of engineers in the implementation and design of customer ingest and delivery workflows.
- Designed and implemented an email ingestion workflow for customer files to integrate with our AWS cloud hosted system.
- Designed and implemented a templated container lambda project to kick start development across the dev organization.
- Designed and implemented integration with Sharefile as another venue of file ingestion from customers.
 - Implemented RClone in a standalone service to greatly decrease the complexity of migrating files from Sharefile to AWS S3 after identifying an over engineered solution.
- Designed third party integrations with various enhancement APIs to provide customers with more insight into their data.
- Implemented automated code-coverage badge generation in the dev organization CLI to be used across teams in support of code standards.
- Implemented and designed standardized error-handling for our "Ingest 2.0" redesign AWS step-function workflow.
 - Leveraged Datadog as a tool for log metrics aggregation and monitoring.
 - Integrated slack as a method of notifying dev-team of successful and failed ingestions.
 - Integrated AWS SES to notify customers of errors encountered in our system.
- Implemented nightly automated integration testing for ingestion and delivery in Jenkins to increase confidence in our system.
- Ingest Orchestration 2.0 AWS Step Function Release:
 - Created scripts to load-test our newly refactored Ingest workflow.
 - Implemented monitoring dashboards to track performance for customers migrated.
 - Created migration plan for cross-team execution of release.
 - Identified "waves" of customers to be migrated for a smooth, supported delivery.
 - Integrated Datadog with Pagerduty and drafted a team schedule to support customers after hours.
- Identified and reconfigured several AWS resources using unoptimized resource allocation.
- Redesign of our customer management configuration system.
 - Greatly reduced complexity of the current customer management system by identifying pain points directly from our solutions engineering team.
 - Normalized tables across different data sources.
 - Implemented an API for a customer management dashboard.
 - Provided technical leadership in the design and implementation of the project.
- Created templates using terragrunt for dev team to use to streamline terraform AWS resource creation.
- *Technologies:* AWS, AWS Lambda, AWS SES, AWS Step Functions, AWS SQS/SNS/Event Bridge, Python, FastAPI, MongoDB, PostgreSQL, Terraform, Terragrunt

August 2018 - April 2021

Consultant - Manager I | Pariveda Solutions | Atlanta, GA
National Registry Network

- Lead team of engineers in creating a "coupling" feature for an already existing React/Serverless AWS application.

- Added multiple reusable UI components and API endpoints to support features while maintaining scope, ticket estimates, and delivery risks and issues in order to deliver the feature on time.
- *Technologies:* Agile; AWS; AWS Lambda; React; Serverless Framework; Typescript

Large Financial Client

- Developed a configurable data streaming pipeline with AWS resources to rapidly ingest large amounts of data from multiple external sources. The data was immediately queryable using AWS Athena and Redshift by internal data engineers to deliver crucial business insights for their financial institution.
- The platform contained a robust operational data log in a relational structure leveraging AWS Aurora with accessible data for the internal operations team to monitor the platform in real-time.
- Delivered a 100% asynchronous event driven platform.
 - Each event passed through the system was delivered entirely asynchronously. From the ingestion of data, to the ETL work initiated on each dataset.
 - There was a constant "stream" of data based on configuration setup by internal data engineers. This meant that at any given time, there could be X number of ingestions happening at once in our scalable AWS platform.
- *Technologies:* Aurora RDS; AWS CloudFormation; AWS CodeBuild; AWS CodePipeline; AWS Lambda; AWS S3; DynamoDB; PostgreSQL; Python

Consultant - Associate II | Pariveda Solutions | Atlanta, GA

Automotive Industry Client

- Enhanced full stack admin application hosted in AWS Elastic Beanstalk using Express.js, React.js, and other AWS resources.
- Enhancements included:
 - Managing permissions by purchasing customers
 - Supporting feature tags for customers
 - Migrating microservice javascript service to AWS Lambda and AWS API.
 - Visual enhancements to ease user experience
- Migrated customer account API endpoints to a Node.js/Express.js application hosted in the AWS Cloud.
 - With all the necessary endpoints moved over, we then sunset the old API so the client could turn off redundant resources.
- Lead effort to migrate payment information API created in hapi.js and hosted in EC2 to a serverless AWS lambda/API-gateway solution.
 - Participated in discussions with architectural leads at the client to agree on an AWS solution.
 - Created architecture diagram to assist the team in understanding the overall design from a high level.
 - Developed solution in typescript to map old API request to new expected API contract.
 - Introduced typedoc to assist with application documentation.
 - Created lambda solution, triggered by cloudwatch logs, to stream logs to Splunk for further analysis.
 - Lead architectural review meeting with the team to create an "orchestration" layer, hosted in Elastic Beanstalk, in front of Lambda API to manage data aggregation between different APIs.
 - Created AWS CodeBuild cloudformation templates to empower deployment processes through automation.
 - Created AWS CodePipeline cloudformation templates to handle deployments to different environments.
 - Implemented postman integration testing to ensure stability of the API.
 - Integrated postman tests with CodePipeline using a separate lambda to automate the testing process during deployments.
 - Coached team in Agile processes and ceremonies.
 - Coached team in various AWS technologies such as Lambda, CloudFormation, and more.

- Deployed application to production successfully, test users consuming the new API.
- *Technologies:* AWS, AWS API Gateway, AWS Lambda, Node.js, Express, MongoDB

Automotive Industry Client

- Lead small team of engineers from start to finish to deliver a geolocation service centered around AWS Lambda, RDS, CloudFormation, Route 53, and other aws resources.
 - Recognized a cost saver by converting clients geolocation queries from Google APIs to a custom AWS cloud solution.
 - Created an early POC to prove to the business that the solution was possible.
 - Presented multiple options to client architectural leads and business stakeholders at different checkpoints throughout the development process.
 - Created system architecture documentation and supplemental material to support the benefits of our AWS cloud solution.
 - Worked with multiple teams to create a deployment strategy using cloudformation and jenkins.
 - Implemented and executed load testing and performance testing plans to ensure the application could handle maximum traffic.
 - Ensured a highly available, fault tolerant solution by creating a cross-region deployment strategy. This included cross-region replication of database, lambdas, and other important aws resources.
 - Successfully deployed and supported the application past production deployment. Leveraged alerts, monitoring, and other tools in CloudWatch to create robust production support.
 - Achieved a 95% accuracy rate against GoogleMaps API for geolocation queries such as IP to Latitude and Longitude and Zipcode to Latitude and Longitude.
 - Analyzed application during process to ensure no PII was being stored inappropriately.
 - Maintained an agile development cycle throughout the creation and support of the application.
 - Worked closely with business stakeholders to verify the accuracy and performance required by the application.
- Produced early architecture diagrams, support materials, and presentation for the client for a simple digital asset management solution created in AWS cloud leveraging S3 and other resources.
 - Recognized the client had many pain points with cost and usability with current application.
 - Presented potential solutions to business stakeholders and architecture leads.
 - Analyzed the cost impact of a React/Express.js application hosted in EC2, fetching large amounts of data from S3 on a daily basis.
 - Explained the cost benefit between a custom cloud solution and third-party solution.
 - Successfully received a contract from the business.
- Maintained professional relationships with team members at the client.
- Coached and supported team members new to consulting, development, and cloud solutions.
- *Technologies:* AWS, Relational Databases, AWS Lambda, Node.js

APR 2016 - August 2018

Software Developer | Insight Global | Atlanta, GA

- Led front end development on an enterprise software suite from the ground up using TypeScript, JavaScript, Angular 2, Angular CLI, SCSS, and other front end technologies.
- Worked closely with BAs, POs, and UX to accomplish tasks and directly receive feedback from end users to ensure a quality product.
- Developed Angular 2 application using best practices in structure, naming convention, and code to increase reusability and efficiency.
- Established single sign on with Microsoft Active Directory using Keycloak and JWT management.
- Worked closely with the QA team to ensure quality and stability of front end application and keep the QA environment up to date with the latest code.

- Pushed for continuous integration using Jenkins to deliver features more frequently and automate deployment.
- Used RESTful services to implement business logic and data integration to the front end.
- Provided mentoring and technical training for new employees to get them caught up on Angular 4.0.
- Led a team of developers in taking over third party projects, implemented new features, and cleaned up previous content while maintaining an Agile process.
- Leveraged Kafka for sending information between multiple business applications and microservices.
- Developed several Kafka producers and consumers to migrate data from multiple databases.
- Implemented receipt OCR using Google Vision API to parse uploaded receipt information for a user.
- Hands-on experience with Spring and Spring Boot using the framework to decrease development time and increase modularity through dependency injection.
- Leverage Hibernate to query databases to store information and return information for use in the front-end.
- Maintained and implemented a suite of custom directives and components in Angular 4 including: form validation, custom table, dynamic forms, page highlighting, and more.
- Communication with the open systems team to ensure stable deployments.
- Introduced gitflow workflow with feature branching to help manage stable releases.

OCT 2015 - MAR 2016

Front End Developer | Good Done Great | Charleston, SC

- Wrote maintainable and extensible code in an agile environment.
- Modified existing software to correct errors, upgrade interfaces and improve performance.
- Updated and created new views for DonateWell.com UI using Angular 1.5.
- Fixed active bugs in Javascript, CSS, and more.
- Collaborated on future features for DonateWell software.

EDUCATION

2015

Comprehensive Coding School: Front End Development

The Iron Yard - Charleston, SC

2014

BBA: Marketing

Mercer University - Macon, GA
